

## 7.6 The Derivative and Graphing (2 days?)

**Definition:** A function is increasing when the function has a positive slope.

**Definition:** Similarly, a function is decreasing when the function has a negative slope.

**Example 21:** Write the intervals on which the function is increasing and decreasing.

Inc:  $(0, \infty)$   
Dec:  $(-\infty, 0)$

Inc:  $(-\infty, \infty)$   
Dec: none

Inc:  $(-\infty, 0) \cup (2, \infty)$   
Dec:  $(0, 2)$

**Definition:** If  $f'(x) > 0$  for all  $x$  in  $(a,b)$ , then  $f$  is increasing on  $(a,b)$ .

**Definition:** If  $f'(x) < 0$  for all  $x$  in  $(a,b)$ , then  $f$  is decreasing on  $(a,b)$ .

**Definition:** A stationary point is where  $f'(x) = 0$ .

**Definition:** A critical number of  $f$  is a point where  $f'(x) = 0$  OR  $f'(x)$  is undefined.

**Example 22:** Use the derivative of  $f$  to find the intervals on which  $f$  is increasing or decreasing.

Homework  
7Q

a.)  $f(x) = 2x^3 - 3x^2 - 12x$   
 $f'(x) = 6x^2 - 6x - 12$   
 $6(x^2 - x - 2) = 0$   
 $(x-2)(x+1) = 0$   
 $x = -1, 2$

+	-	+
-1	2	

(plug #s into  $f'(x)$ )

b.)  $f(x) = \frac{x^2-4}{x^2-1}$

$$\frac{2x(x^2-1) - 2x(x^2-4)}{(x^2-1)^2}$$

$$\frac{2x^3 - 2x - 2x^3 + 8x}{(x^2-1)^2}$$

$$\frac{6x}{(x^2-1)^2} = 0$$

$6x = 0 \implies x = 0$   
undefined @  $\pm 1$

increasing  $(-\infty, -1) \cup (1, \infty)$   
decreasing  $(-1, 2)$

-	+	+
-1	0	1

c.)  $f(x) = x^3$   
 $f'(x) = 3x^2$   
 $3x^2 = 0$   
 $x = 0$

+	+
0	

increasing:  $(-\infty, 0) \cup (0, \infty)$   
 decreasing: none

## FIRST DERIVATIVE TEST

**Definition:** A function has a relative maximum (or local) when the function changes from increasing to decreasing. Hence, if  $f'(x)$  changes from positive to negative at  $x = c$ , then  $f$  has a relative maximum at  $(c, f(c))$ .

**Definition:** A function has a relative minimum (or local) when the function changes from decreasing to increasing. Hence, if  $f'(x)$  changes from negative to positive at  $x = c$ , then  $f$  has a relative minimum at  $(c, f(c))$ .

**\*Note:** if  $f'(x)$  does not have to change sign at a critical number. If this happens, there is neither a relative maximum or minimum at that point.

**Example 23:** Use the first derivative test to find the relative extrema for the functions in Example 22. (copy diagrams from last example)

a.)  $f(x) = 2x^3 - 3x^2 - 12x$   
 $\begin{array}{c|c|c} + & - & + \\ \hline -1 & 2 & \end{array}$  max@  $x = -1$   
 min@  $x = 2$   
 $f(-1) = 7$   $f(2) = -20$

b.)  $f(x) = \frac{x^2-4}{x^2-1}$   
 $\begin{array}{c|c|c|c} - & \oplus & - & \oplus \\ \hline -1 & 0 & 1 & \end{array}$   
 min@  $x = 0$  max: none

c.)  $f(x) = x^3$   
 $\begin{array}{c|c} + & + \\ \hline 0 & \end{array}$  no max  
 no min

relative maximum  $(-1, 7)$  relative minimum  $(2, -20)$  relative min  $(0, 4)$

Homework 7R

## Concavity TEST

**Definition:** If  $f''(x) > 0$  for all  $x$  in  $(a, b)$  then  $f$  is concave up on  $(a, b)$ .

**Definition:** If  $f''(x) < 0$  for all  $x$  in  $(a, b)$ , then  $f$  is concave down on  $(a, b)$ .

**Definition:** A point on the graph of  $f$  is an inflection point if  $f''(x) = 0$  AND if  $f''$  changes signs.

**Example 24:** For functions from Example 22, use the second derivative to find the intervals where the function is concave up and concave down. Also find the inflection points. (see bk pg 236)

a.)  $f(x) = 2x^3 - 3x^2 - 12x$   
 $f'(x) = 6x^2 - 6x - 12$  CC  $\uparrow$   $(\frac{1}{2}, \infty)$   
 $f''(x) = 12x - 6$  CC  $\downarrow$   $(-\infty, \frac{1}{2})$   
 $12x - 6 = 0$   
 $x = \frac{1}{2}$   
 $\begin{array}{c|c} - & + \\ \hline \frac{1}{2} & \end{array}$   
 inf. pt  $(\frac{1}{2}, f(\frac{1}{2}))$   $(\frac{1}{2}, -6.5)$   
 plug into  $f''(x)$

b.)  $f(x) = \frac{x^2-4}{x^2-1}$   $f'(x) = \frac{6x}{(x^2-1)^2}$   
 $f''(x) = \frac{6(x^2-1)^2 - 2(x^2-1) \cdot 2x \cdot 6x}{((x^2-1)^2)^2}$   
 $\frac{6(x^2-1)^2 - 24x^2(x^2-1)}{(x^2-1)^4}$   
 $\frac{(x^2-1)[6x^2 - 6 - 24x^2]}{(x^2-1)^4}$

c.)  $f(x) = x^3$   
 $f''(x) = \frac{-18x^2 - 6}{(x^2-1)^3} = 0$   
 $-18x^2 - 6 = 0$   
 $x^2 = -\frac{1}{3}$   
 no solution  
 $x \neq \pm 1$   
 no inflection  
 $\begin{array}{c|c|c} - & + & - \\ \hline -1 & 1 & \end{array}$   
 CC  $\uparrow$   $(-1, 1)$   
 CC  $\downarrow$   $(-\infty, -1) \cup (1, \infty)$   
 Homework 7S

Amuk 7T

**Example 25:** Sketch the graph of each function. Use the information you found in Examples 22-24 and intercepts and asymptotes to help draw the graph.

x-int:  $0 = 2x^3 - 3x^2 - 12x$   
 $x(2x^2 - 3x - 12)$   
 $x=0$   
 Q. ind. Formula!

a.)  $f(x) = 2x^3 - 3x^2 - 12x$

inc:  $(-\infty, -1) \cup (2, \infty)$   
 dec:  $(-1, 2)$   
 relative max:  $(-1, 7)$   
 relative min:  $(2, -20)$   
 concave down:  $(-\infty, 1/2)$   
 concave up:  $(1/2, \infty)$   
 inflexion point:  $(1/2, -6.5)$   
 x-int:  $(0, 0)$   $(\frac{3 \pm \sqrt{108}}{4}, 0)$   
 y-int:

Vertical  
 $x^2 - 1 = 0$   
 $x = \pm 1$

b.)  $f(x) = \frac{x^2 - 4}{x^2 - 1}$

Hor. Asym.  
 $\frac{1x^2}{1x^2} = 1$

inc:  $(0, 1) \cup (1, \infty)$   
 dec:  $(-\infty, -1) \cup (-1, 0)$   
 relative max: none  
 relative min:  $(0, 4)$   
 concave down:  $(-\infty, -1) \cup (1, \infty)$   
 concave up:  $(-1, 1)$   
 inflexion point: none (asympt pt)  
 x-int:  $(2, 0)$   $(-2, 0)$   
 y-int:  $(0, 4)$

c.)  $f(x) = x^3$

inc:  $(-\infty, \infty)$   
 dec: None  
 relative max: none  
 relative min: none  
 concave down:  $(-\infty, 0)$   
 concave up:  $(0, \infty)$   
 inflexion point:  $(0, 0)$   
 x-int:  $(0, 0)$   
 y-int:  $(0, 0)$

**Example 26:**

a.) Given the graph shown (pg. 239) is a graph of  $f$ , sketch the graphs of  $f'$ , and  $f''$ .

$f$  is dec.  $(-\infty, 2) \rightarrow f'$  is neg  $(-\infty, 2)$   
 $f$  is inc  $(2, \infty) \rightarrow f'$  is pos  $(2, \infty)$   $f'$  is zero at 2

Since  $f'(x)$  is linear,  $f''(x)$  must be a constant

Since  $f$  is always concave up, it's a positive constant

b.) Given the graph shown is a graph of  $f'$ , sketch graphs of  $f$  and  $f''$ .

$\begin{matrix} \nearrow & \searrow & \nearrow \\ | & | & | \\ -1 & & 5 \end{matrix}$ 
 since  $f'$  is negative from  $(-1, 5)$   
 $f$  is decreasing  $(-1, 5)$   
 since  $f'$  is positive  $(-\infty, -1)$  and  $(5, \infty)$   
 $f$  is increasing & max @  $x = -1$ , min  $x = 5$

$f''$  is linear because of discussion above
